A SCIENTIST OF THE FUTURE RECORDS EXPERIMENTS WITH A TOY CAMERA FITTED WITH UNIVERSAL-FOCUS LENS. THE SMALL SQUARE IN THE EYEGLASS AT THE LEFT SIGHTS THE ONE

AS WE MAY THINK

A TOP U.S. SCIENTIST FORESEES A POSSIBLE FUTURE WORLD
IN WHICH MAN-MADE MACHINES WILL START TO THINK

by VANNEVAR BUSH

DIRECTOR OF THE OFFICE OF SCIENTIFIC RESEARCH AND DEVELOPMENT

Condensed from the Atlantic Monthly, July 1945

This has not been a scientists' war; it has been a war in which all have had a part. The scientists, burying their old professional competition in the demand of a common cause, have shared greatly and learned much. It has been exhilarating to work in effective partnership. What are the scientists to do next?

For the biologists, and particularly for the medical scientists, there can be little indecision, for their war work has hardly required them to leave the old paths. Many indeed have been able to carry on their war research in their familiar peacetime laboratories. Their objectives remain much the same.

It is the physicists who have been thrown most violently off stride, who have left academic pursuits for the making of strange destructive gadgets, who have had to devise new methods for their unanticipated assignments. They have done their part on the devices that made it possible to turn back the enemy. They have worked in combined effort with the physicians of our allies. They have felt within themselves the stir of achievement. They have been part of a great team. Now one asks where they will find objectives worthy of their best.

* * *

There is a growing mountain of research. But there is increased evidence that we are being bogged down today as specialization extends. The investigator is staggered by the findings and conclusions of thousands of other workers—conclusions which he cannot find time to grasp, much less to remember, as they appear. Yet specialization becomes increasingly necessary for prog-

ress, and the effort to bridge between disciplines is correspondingly sup-

erfluous. Professionally our methods of transmitting and reviewing the results of research are generations old and by now are totally inadequate for their present purpose. If the aggregate time spent in writing scholarly works and in reading them could be evaluated, the ratio between these amounts of time might well be startling. Those who conscientiously attempt to keep abreast of current thought, even in restricted fields, by close and continuous reading might well shy away from an examination calculated to show how much of the previous month's efforts could be produced on call.

Mendel's concept of the laws of genetics was lost to the world for a generation because his publication did not reach the few who were capable of grasping and extending it. This sort of catastrophe is undoubtedly repeated all about us as truly significant attainments become lost in the noise of the inconsequential.

Publication has been extended far beyond our present ability to make use of the record. The summation of human experience is being expanded at a prodigious rate, and the means we use for threading through this vast ocean make to the momentarily important item is the same as was used in the days of square-rigged ships.

But there are signs of a change as new and powerful instrumentalities come into use. Photocells capable of seeing things in a physical sense, advanced photography which can record what is seen or even what is inferred, thermionic tubes capable of controlling potent forces under the guidance

3:45 p.m. / arena

Chairman:

DR. D. C. ENGELBART

Stanford Research Institute

Menlo Park, California

a research center for augmenting human intellect

This session is entirely devoted to a presentation by Dr. Engelbart on a computer-based, interactive, multiconsole display system which is being developed at Stanford Research Institute under the sponsorship of ARPA, NASA and RADC. The system is being used as an experimental laboratory for investigating principles by which interactive computer aids can augment intellectual capability. The techniques which are being described will, themselves, be used to augment the presentation.

The session will use an on-line, closed circuit television hook-up to the SRI computing system in Menlo Park.

Following the presentation remote terminals to the system, in operation, may be viewed during the remainder of the conference in a special room set aside for that purpose.

[Up to Design Issues](#)*

Linked Data

The Semantic Web isn't just about putting data on the web. It is about making links, so that a person or machine can explore the web of data. With linked data, when you have some of it, you can find other, related, data.

Like the web of hypertext, the web of data is constructed with documents on the web. However, unlike the web of hypertext, where links are relationships anchors in hypertext documents written in HTML, for data they links between arbitrary things described by RDF,. The URIs identify any kind of object or concept. But for HTML or RDF, the same expectations apply to make the web grow:

1. Use URIs as names for things
2. Use HTTP URIs so that people can look up those names.
3. When someone looks up a URI, provide useful information.
4. Include links to other URIs. so that they can discover more things.

Simple. In fact, though, a surprising amount of data isn't linked in 2006, because of problems with

**Use URLs as
names for things.**

David Weinberger

David Weinberger (born 1950 in New York) is an American technologist, professional speaker, and commentator, probably best known as co-author of the Cluetrain Manifesto (originally a website, and eventually a book, which has been described as "a primer on Internet marketing"). Weinberger's work focuses on how the Internet is changing human relationships, communication, and society. A philosopher by training, he holds a Ph.D. from the University ...

Small Pieces Loosely Joined (a unified theory of the web)

Small Pieces Loosely Joined: A Unified Theory of the Web is a book by David Weinberger published by Perseus Publishing in 2002 (ISBN 0-7382-0543-5). The book's central premise is that the world wide web has significantly altered humanity's understanding or perception of the concepts of space, matter, time, perfection, public, knowledge, and morality, each of which comprises the title of a chapter in the book. The web, Weinberger writes, "is enable... [more](#)

Everything is miscellaneous : the power of the new digital disorder by David Weinberger (Book)
6 editions published between 2007 and 2008 in English and held by 1,562 libraries worldwide
Philosopher Weinberger shows how the digital revolution is radically changing the way we make sense of our lives. Human beings constantly collect, label, and organize data—but today, the shift from the physical to the digital is mixing, burning, and ripping our lives apart. In the past, everything had its one place—the physical world demanded it—but now everything has its places: multiple categories, multiple shelves. Everything is suddenly miscellaneous. Weinberger charts the new principles of digital order that are remaking business, education, politics, science, and culture. He examines how Rand McNally decides what information not to include in a physical map (and why Google Earth is winning that battle), how Staples stores emulate online shopping to increase sales, why your children's teachers will stop having them memorize facts, and how the shift to digital music stands as the model for the future.—From publisher description.

Small pieces loosely joined : a unified theory of the Web by David Weinberger (Book)
3 editions published between 2002 and 2003 in English and held by 1,068 libraries worldwide

Weinberger's work focuses on how technology is changing human relationships, communication, and society. A philosopher by training, he holds a Ph.D. from the University of Toronto and taught college from 1980-1986. He was a gag writer for the comic strip "Inside Woody Allen" from 1976-1983. He became a marketing consultant and executive at several high-tech companies, including being a fellow at the Berkman Center for Internet and Society at Harvard Law School, where he co-taught the course "The Digital Difference" with John Palfrey. He had the title Senior Internet Advisor to Howard Dean's 2004 presidential campaign. He also provided technology policy advice to John Edwards' 2008 presidential campaign.</p><ul style="list-style-type: none;">▪ David Weinberger (* 1950 in New York) ist ein US-amerikanischer Redner, Autor und Philosoph. Er beschäftigt sich insbesondere mit der Frage, wie das Internet menschliche Beziehungen, Kommunikation und Gesellschaft verändert. Bekannt wurde das Cluetrain-Manifest, das Weinberger zusammen mit John Palfrey, John Searle und Doc Searls 1999 verfasste. Er prägte circa 2002 den Begriff Infopinion, der sich auf die Verbindung von Information und Meinung bezieht.▪ È un tecnologo, speaker di professione, e commentatore, forse meglio conosciuto come co-autore del manifesto Cluetrain. Il lavoro di Weinberger è focalizzato su come Internet sta cambiando le relazioni umane, la comunicazione e la società. È stato autore della striscia comica "Inside Woody Allen" dal 1976 fino al 1983. È stato consulente tecnologico per diverse aziende high-tech, e attualmente è fellow del Berkman Center for Internet and Society alla Harvard Law School. Ha ottenuto il titolo di Senior Internet Advisor durante la campagna presidenziale 2008 di John Edwards. |

| dbpprop:abstract | <ul style="list-style-type: none">Small Pieces Loosely Joined: A Unified Theory of the Web is a book by David Weinberger published by Perseus Publishing in 2002 . The book's central premise is that the world wide web has significantly altered humanity's understanding or perception of the concepts of space, matter, time, perfection, public, knowledge, and morality, each of which comprises the title of a chapter in the book. The web, Weinberger writes, "is enabling us to rediscover what we've always known about being human: we are connected creatures in a connected world about which we care passionately." |

About: Internet

An Entity in Data Space: dbpedia.org

The Internet is a global network of interconnected computers, enabling users to share information along multiple channels. Typically, a computer that connects to the Internet can access information from a vast array of available servers and other computers by moving information from them to the computer's local memory.

| Property | Value |
|-----------------|---|
| dbprop:abstract | <p>■ The Internet is a global network of interconnected computers, enabling users to share information along channels. Typically, a computer that connects to the Internet can access information from a vast array of available servers and other computers by moving information from them to the computer's local memory. The same connection allows that computer to send information to servers on the network; that information is accessed and potentially modified by a variety of other interconnected computers. A majority of widely accessible information on the Internet consists of inter-linked hypertext documents and other resources of the World Wide Web. Computer users typically manage sent and received information with web browsers; client software for users' interface with computer networks includes specialized programs for electronic mail, file transfer, and chat, file transfer and file sharing. The movement of information in the Internet is achieved via a system of interconnected computer networks that share data by packet switching using the standardized Internet Protocol Suite (TCP/IP). It is a "network of networks" that consists of millions of private and public, academic, business and government networks of local to global scope that are linked by copper wires, fiber-optic cables, wireless connections, and other technologies.</p> <p>■ Et internet er betegnelsen for et netværk af computernetværk, som er koblet sammen. Ofte taler man om internettet, der så betegner et globalt netværk af sammenkoblede computere. Internettet er en af de vigtigste opfindelser fra det 20. århundrede. Ikke fordi det i sig selv er noget teknisk vidunder, men på grund af den konsekvenser det har for vores måde at leve vores liv på. I det der stadig kun kan kaldes dets spæde start, bliver internettet især brugt til at dele tekstbaseret information, og nogle af de mest kendte koncepter er bl.a. blog, forum, wiki og websteder. For fremtiden vil koncepter såsom Video on demand og Voice over IP formodentlig blive standardiserede i vores dagligdag, at de afløser henholdsvis fjernsynet og den traditionelle telefon.</p> <p>■ Internet es un conjunto descentralizado de redes de comunicación interconectadas, que utilizan la familia de protocolos TCP/IP, garantizando que las redes físicas. Uno de los servicios que más éxito ha tenido en Internet es el World Wide Web (WWW, o "la Web"), hasta tal punto que es habitual la confusión entre ambos términos. La WWW es un conjunto de protocolos que permite, de forma sencilla, la consulta remota de información de hipertexto. Ésta fue un desarrollo posterior y utiliza Internet como medio de transmisión. Existen, por supuesto, muchos otros servicios y protocolos en Internet, aparte de la Web: el envío de correo electrónico, la transferencia de archivos, las conversaciones en línea, la mensajería instantánea y presencia, la transmisión de contenido multimedia -telefonía, televisión-, los boletines electrónicos, el acceso remoto a otras máquinas o los juegos en línea. El género de la palabra Internet es ambiguo, según el Diccionario de la Real Academia Española.</p> |

Chronicling America: Historic American Newspapers

Welcome to Chronicling America, enhancing access to America's historic newspapers. This site allows you to search and view newspaper pages from 1880-1910 and find information about American newspapers published between 1690-present. Chronicling America is sponsored jointly by the National Endowment for the Humanities and the Library of Congress as part of the National Digital Newspaper Program (NDNP).

| Title | Biological knowledge management: the emerging role of the Semantic Web technologies |
| Publication Status | published |
| Abstract | New knowledge is produced at a continuously increasing speed, and the list of papers, databases and other knowledge sources that a researcher in the life sciences needs to cope with is actually turning into a problem rather than an asset. The adequate management of knowledge is therefore becoming fundamentally important for life scientists, especially if they work with approaches that thoroughly depend on knowledge integration, such as systems biology. Several initiatives to organize biological knowledge sources into a readily exploitable resourceome |

The Dublin Core® Metadata Initiative

The Dublin Core Metadata Initiative, or "DCMI", is an open organization engaged in the development of interoperable metadata standards that support a broad range of purposes and business models. DCMI's activities include [work on architecture and modeling](#), discussions and collaborative work in [DCMI Communities](#) and [DCMI Task Groups](#), annual [conferences and workshops](#), standards liaison, and educational efforts to promote widespread acceptance of metadata standards and practices.

DC-2010 to be held in Pittsburgh, 20-22 October 2010

2009-10-14, DCMI is pleased to announce that DC-2010 will take place 20-22 October 2010 in Pittsburgh, Pennsylvania, USA. The conference will be held in conjunction with the Annual Meeting of the [American Society for Information Science and Technology \(ASIS&T\)](#) which is scheduled for 24-27 October 2010 in the same location. Further announcements will be released in the coming months.

DCMI home page <http://dublincore.org/> redesigned to orient interested newcomers

2009-10-06, The DCMI home page <http://dublincore.org/> has been redesigned with four new "landing pages": [Metadata Basics](#), [DCMI Specifications](#), [Community and Events](#), [About Us](#), and a new [Site Map](#).

Guidelines for Publishing Open Government Data Published

In line with its [anticipated focus on Open Government Data](#), the [eGovernment Interest Group](#) announces today a first draft of [Publishing Open Government Data](#), which provides step-by-step guidelines for putting government data on the Web. Sharing data according to these guidelines enables greater transparency; delivers more efficient public services; and encourages greater public and commercial use and re-use of government information.

Improving Access to Government through Better Use of the

eGovernment refers to the use of the Web or other information technologies by governing bodies to interact with the citizenry, between departments and divisions, and between governments themselves.

Creating a Science of the Web

The Web is the largest human information construct in history. The Web is transforming society. In order to...

- understand what the Web is
- engineer its future
- ensure its social benefit

...we need a new interdisciplinary field that we call *Web Science*.

The [Web Science Research Initiative](#) brings together academics, scientists, sociologists, entrepreneurs and decision makers from around the world. These people will create the first multidisciplinary research body to examine the World Wide Web and offer the practical solutions needed to help guide its future use and design.

public-lod@w3.org Mail Archives

Maintaining Activity: Semantic Web Activity

List Purpose: The public-lod@w3.org mailing list provides a discussion forum for members of the [Linking Open Data project](#) and the broader Linked Data community. The Linking Open Data project is a grassroots community effort founded in February 2007 as a W3C [Semantic Web Education and Outreach Interest Group](#) Community Project. The aim of the project is to identify datasets that are available under open licenses, re-publish these in RDF on the Web and interlink them with each other.

The [Linking Open Data project wiki pages](#) provide additional background information about the project. The project's mailing list was hosted by the [MIT SIMILE](#) project until Spring 2008; MIT also maintains an [archive](#) of the list until that point.

TIMBERNERS-LEE

Play Back Forward Volume 00:20 | 16:20 Share Rate

About this talk Open interactive transcript »

20 years ago, Tim Berners-Lee invented the World Wide Web. For his next project, he's building a web for open, linked data that could do for numbers what the Web did for words, pictures, video: unlock our data and reframe the way we use it together.

About Tim Berners-Lee

Tim Berners-Lee invented the World Wide Web. He leads the World Wide Web Consortium, overseeing the Web's standards and development. [Full bio and more links](#)

 TED2006 Hans Rosling shows the

Library of Congress controlled vocabularies and their application to the Semantic Web

By Corey A. Harper and Barbara B. Tillett

SUMMARY:

This article discusses how various controlled vocabularies, classification schemes and thesauri can serve as some of the building blocks of the Semantic Web. These vocabularies have been developed over the course of decades, and can be put to great use in the development of robust web services and Semantic Web technologies. The article covers how initial collaboration between the Semantic Web, Library and Metadata communities are creating partnerships to complete work in this area. It then discusses some cores principles of authority control before talking more specifically about subject and genre vocabularies and name authority. It is hoped that future systems for internationally shared authority data will link the world's authority data from trusted sources to benefit users worldwide. Finally, the article looks at how encoding and markup of vocabularies can help ensure compatibility with the current and future state of Semantic Web development and provides examples of how this work can help improve the findability and navigation of information on the World Wide Web.
